

Reykjavík, April 20<sup>th</sup> 2011

## Summary of radionuclide concentrations in air

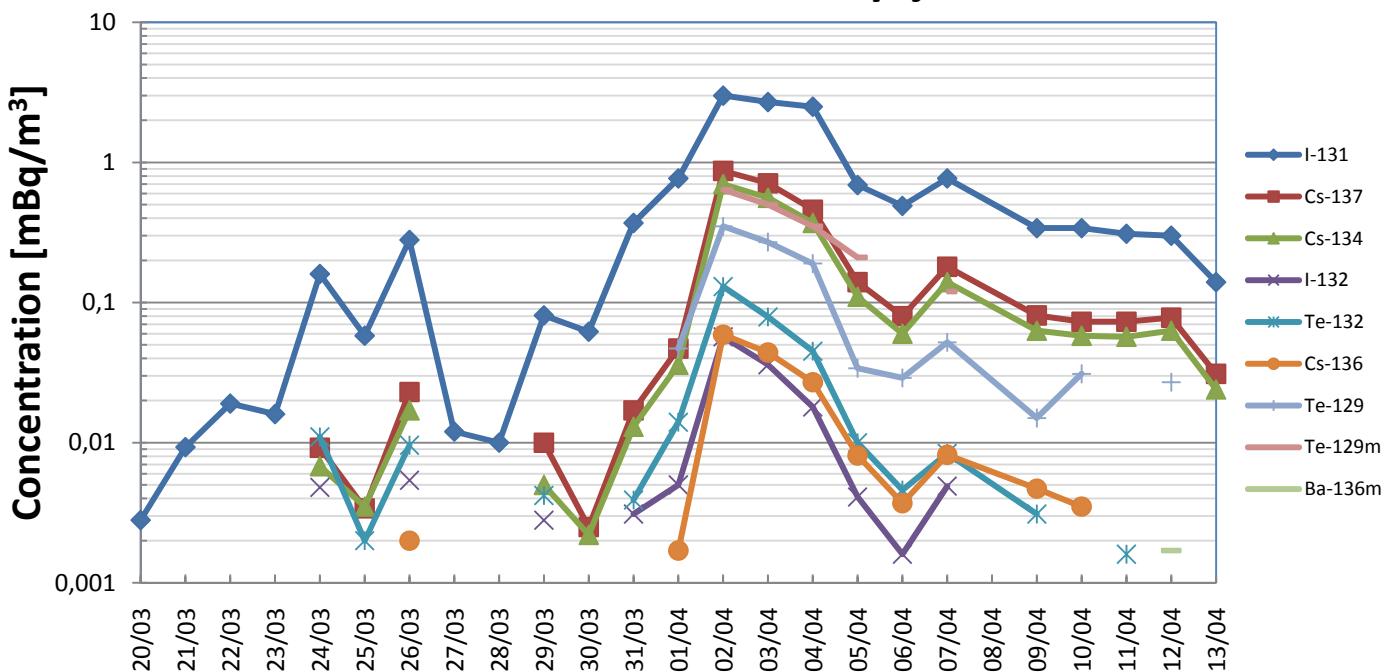

March 19<sup>th</sup> - April 13<sup>th</sup>, Reykjavík, Iceland (64°08'N, 21°56'W)

Radionuclides from Fukushima were first detected in samples collected during the March 19<sup>th</sup>-20<sup>th</sup> sampling period. Aerosol samples are collected for 24 hours, with filters changed daily at 13:30 UTC. Total daily air volume throughput is on average 15 000 m<sup>3</sup>. Minimum detectable concentrations for I-131, Cs-137, Cs-134, and Cs-136 are approximately 0.002-0.003 mBq/m<sup>3</sup> (2–3 µBq/m<sup>3</sup>).

The Cs-137/I-131 ratio was typically 4–8% in the beginning (March 25<sup>th</sup> – April 2<sup>nd</sup>), with the exception of March 27<sup>th</sup>–28<sup>th</sup>. After the increase in concentrations observed on April 3<sup>rd</sup>, the ratio increased to 20–30%.

The Cs-134/Cs-137 ratio has remained relatively stable at 70 – 80% during the period since these radionuclides were first detected in a sample from March 23<sup>rd</sup>–24<sup>th</sup>.

### Concentrations in aerosols in Reykjavík, Iceland

## Data table

Date*	I-131	Cs-137	Cs-134	I-132	Te-132	Cs-136	Te-129	Te-129m	Ba-136m
