Ingiríðarstaðir 2013.

Framvinduskýrsla

Fornleifarannsóknir á Ingiríðarstöðum í Þegjandadal, S-Þingeyjarsýslu, var fram haldið dagana 19. til 30. ágúst 2013. Var það sjötta ár rannsóknanna, en verkefnið er á vegum Hins þingeyska fornleifafélags og unnið af hópi fornleifafræðinga frá Fornleifastofnun Íslands. Rannsóknin naut stuðnings frá fornminjasjóði.

Howell Magnús Roberts stjórnaði uppgreftinum og aðrir leiðangursmenn voru Louise Felding, Lísabet Guðmundsdóttir, Gisli Pálsson og Mads Bakken Thostrup. Garðar Guðmundsson tók loftmyndir af uppgrافتarsvæðinu og Sigurður Bergsteinsson minjavörður kom 28. ágúst á vettvang til að fylgjast með framvindu verksins.

Rannsóknin náði til um 70 fermetra svæðis alls, sem skiptist í þrjá reiti, a, b, og c (sjá mynd 5)

Svæði 2013_A. Reitur A þakti 34 m² og liggur beint norður og vestur af uppgrافتarvangi 2012. Engar grafir komu í ljós á svæðinu. Hinsvegar fannst ein, og mjög stór stoðarhola, við suðurmörk uppgrافتarins. Svipar henni til stoðarhola sem fundust bæði árin 2010 og 2011. Holan er stutt norðvestur frá steinhaugnum sem fannst árið 2012, og kann að eiga við þann haug, þó samhengið þar á milli sé ekki skýrt. Væntanlega hefur e.k. stoð verið reist og látin standa upp á endann á þessum stað, en engan veginn er ljóst í hvaða tilgangi það hefur verið gert.

Svæði 2013_B. Reitur B var samsvarandi að stærð, eða 32m² og lá norðan og vestan við svæði A. Á reitnum vottaði fyrir raski, þúfum og holum sem minntu á ummerki um fornar grafir er rannsakaðar höfðu verið fyrri ár.

Við uppgröft komu í ljós tvær grafir með mjóu hafti á milli þeirra og svipar til kumlapara sem fundist hafa á hverju ári frá upphafi rannsókna. Ljóst var að báðum gröfunum hafði verið raskað fyrir margt löngu, rétt eins og allar grafir sem fundist hafa til þessa á Ingiríðarstöðum, og reyndar í allri sýslunni síðustu ár. Gjóskulög eru vel varðveitt í dalnum og sjá mátti að Heklulag sem talið er að hafi fallið um 1300 lá ekki aðeins yfir gröfunum, heldur og raskinu sem þær höfðu orðið fyrir síðar. Grafirnar voru báðar aflangar og ofan í þeim fylling af lausum jarðvegi og stöku steinum. Talsvert var af beinum í báðum gröfum, en í lélegu ástandi og sundurlaus. Í nyrðri gröfinni voru nokkur hestbein sem lágu eðlilega saman, nokkur leggjabein og hestkjálki, en einnig stök mannstönn. Í syðri gröfinni voru einnig fáeinir laglar og járnbrott.

Í hornum syðri grafar voru stoðarholur, svipaðar og fundist hafa við nokkrar aðrar grafir á teignum. Líklegt er að stoðirnar hafi borið upp e.k. skýli yfir gröfinni, hugsanlega úr skinni eða tauí.

Svæði 2013_C. Grafinn var 3m² skurður suður af svæði B og vestur af svæði A. Tilefnið var að kanna ójöfnur á yfirboði sem svipaði ögn til staða þar sem grafir hafa leynst undir. Í ljós kom að þar voru engin mannvirki og engin ummerki um mannvist að öðru leyti en því að landnámssyrpuna vantaði. Gæti það verið af náttúrlegum ástkæðum, en hugsanlega vegna niðurgraftar, eða stungið hafi verið torf á þessum bletti.

An Interim Statement

Between August 19th-30th a team of archaeologists from Fornleifastofnun Íslands excavated further areas within the pre-Christian burial field at Ingiríðarstaðir in Þegjandadalur on behalf of Hið Þingeyska Fornleifafélag. The project was funded by Fornminjasjóður.

The team was led by Howell Magnus Roberts, with Louise Felding, Lísabet Guðmundsdóttir, Gisli Pálsson and Mads Bakken Thstrup (19th-23rd). The excavation was inspected by Sigurður Bergsteinsson on behalf of Minjastofnun Íslands on August 28th. Garðar Guðmundsson visited to take aerial photographs the same day.

Three areas were investigated, totalling circa 70m² within the larger area outlined in the project proposal and permit application. All targeted visible surface features.

Area 2013_A - 34m² - located directly north and west of the 2012 area. Excavation revealed a substantial post setting at the southern limit of the area, similar to features discovered in 2010 and 2011 (see Figure 3). The purpose of such posts remains enigmatic, but could represent a flagpole or similar construction.

Area 2013_B - 32m² - located north and west of Area A, targeting the northwestern most surface anomaly visible prior to excavation (see Figure 5). Excavation revealed a double grave, similar to those found previously. Both features had previously been re-opened on at least 2 occasions prior to 1300, as indicated by intact H-1300 tephra horizons sealing both the original graves and later truncations. Removal of mixed silty fills containing frequent fist sized stones exposed a significant quantity of bone in both features. This bone was nonetheless seen to be in a poor to moderate condition and largely disarticulated. The northern grave (cut feature [714], fill 708) contained a few articulated elements of horse legs, along with other bone and horse teeth. The southern grave (cut feature [713], fill 709) contained disarticulated horse bone (including a mandible), several other undetermined long bones and also a single human tooth. (see Appendix 3) The southern grave also contained 19 artefacts, being corroded iron nails and other undetermined iron objects (see Figure 6 and Appendix 2).

The corners of the southern grave [713] adjoined/contained post holes ([716], [717], [718] and [719]), of variable form and dimensions as noted previously at Ingiríðarstaðir (see Figure 6). These are interpreted as supports for a lightweight and temporary cover for the southern grave, perhaps an animal skin or a cloth.

Area 2013_C - 3m². Located south of Area B and west of Area A. This exploratory trench targeted a previously unobserved surface anomaly. No archaeological features or layers were discovered, although it is noted that the LNS tephra sequence was absent in this area, possibly due to truncation.

Mynd 1. Loftmynd af uppgriftarsvæði A og B – norður er til hægri. Svæði B er í efra hægra horni, og var 8 x 4 m. Búið var að moka ofan í svæði A þegar myndin var tekin, en sést vel því grænar þökurnar skera sig úr umhverfinu.

Figure 1 - Aerial image of the grave field, showing excavation Areas A and B. Area B is located to the upper right, and measures 8 x 4m. North is right. Area A has been backfilled in this image, but is visible as the greenest of tessellated patches.

Mynd 2. Hrossbein úr nyrðri gröf.

Figure 2 - Semi articulated horse bones within the northern grave.

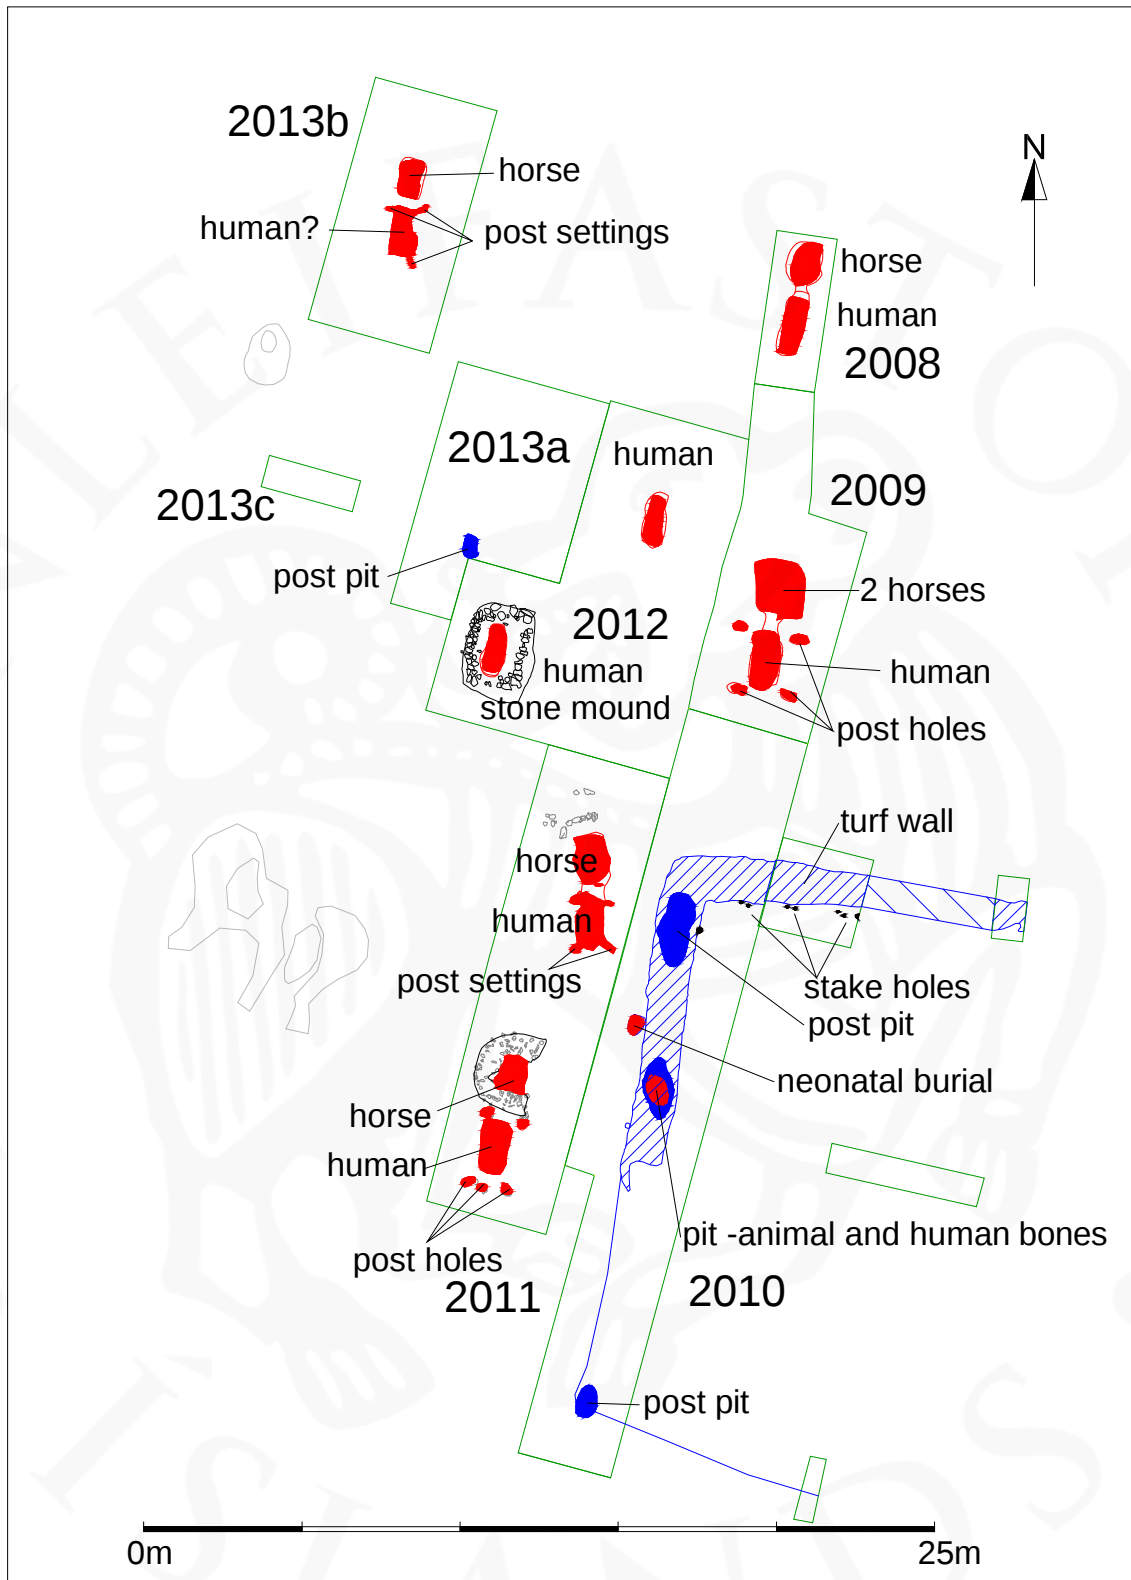

Mynd 3. Stór stoðarhola á svæði A, uppgráfin að hluta.

Figure 3 - Post setting in Area A, partially excavated.

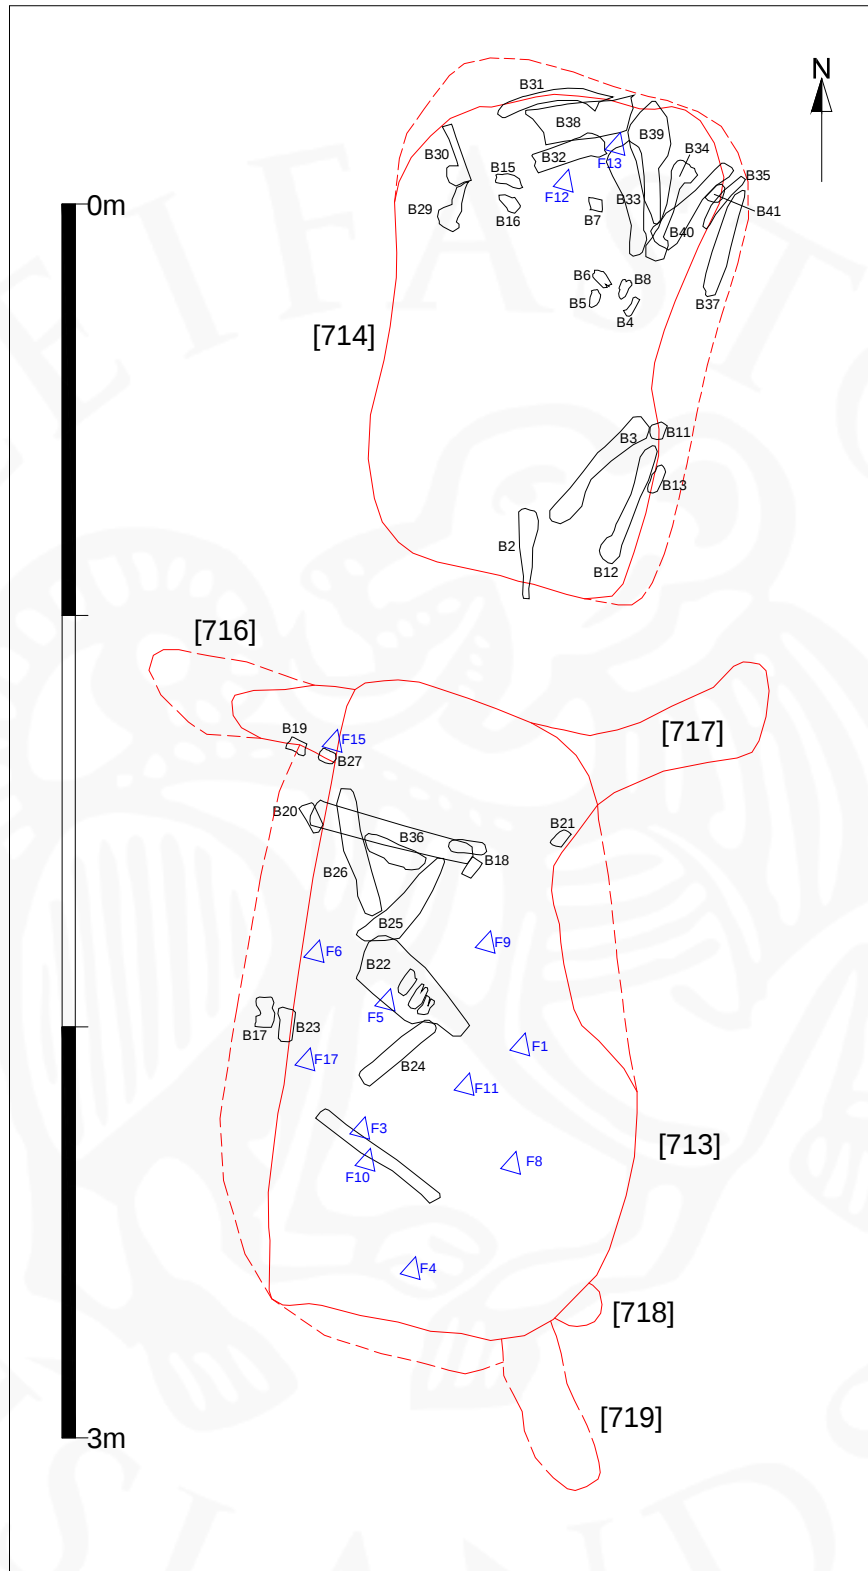

Mynd 4. Tvær grafir á svæði B, eftir uppgröft. Norður er til hægri á myndinni. Stoðarholan í norðvesturhorni syðri grafar sést vel í miðju myndarinnar.

Figure 4 - Graves in Area B after excavation. The post hole within the northwestern corner of the southern grave is clearly visible at the centre of the image. North is to the right.

Mynd 5. Uppdrátturinn sýnir uppgráftarsvæðin 2008-2013.

Figure 5 - Plan of the gravefield - 2008-2013. Graves are shown in red, features interpreted as post-settings in solid blue, turf structures in shaded blue, unexcavated features in grey

Mynd 6. Kuml sem fundust árið 2013. Stoðarholur voru greinilegar við þrjú horn, en ekki voru samsvarandi ummerki við suðvesturhorn.

Figure 6 - Burials discovered in 2013. Postholes are visible with 3 corners, but absent at the southwest. Finds are prefixeded F, bones are prefixed B.
